

## Installation Instructions for Premium Rear Dock Leveler Brush Seal Kit – DLRBS-00-W

1. First, measure dock opening to be sealed. Cut brush seal to the desired length using heavy gauge pliers or cable cutters.
2. (OPTIONAL) You can leave an extra 3” on each end of the brush if you desire to “horseshoe” the brush ends around the sides of the dock leveler for additional coverage. (see diagram below)
3. Adjust the dock leveler in such a way as to create the widest opening between the rear plates for inserting the seal.
4. Start at one end of the rear dock opening and firmly push the brush down into the opening. The brush will squeeze through the gap opening. Once it is in place it will spring back to its normal shape to create an ideal seal. Do not remove the 2” foam adapter cover. Simply compress foam with fingers or blunt object and fit into place.
5. On wider rear dock openings a second brush seal can be inserted on top of the first to greatly improve the function of the seal.
